

Fork Positioner for Forklift

Forklift Fork Positioners - The fork positioner is a hydraulic device that could allow the driver to control the forklift without leaving the seat. They are made out of high quality materials and are designed to be able to withstand the most challenging operations and work environments. Side shifting units have the added ability to laterally position the arms or the entire load in order to facilitate much more accurate carrying and position in a faster and much more efficient method.

The unique fork pocket design could enable the person operating it to be able to securely sway the unit's blades without any fear of damaging the positioning cylinders. This allows the operator the alternative to either perform independent or simultaneous blade movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages could be transformed into blade positioners on available units.
